ABSTRACT

Pompom pet shop information system This Petshop Information System is created to help additional problems in sales, financial management and inventory on every transaction with a large transaction In the current situation, most pet shops handle their operations using manual or semi-automated systems. Consequently, customer consignment can be doomed to a lack of satisfaction given the inefficiencies/excessive finance billings and never ending service delivery. The need for a user-friendly, full-featured platform that could support inventory and financial functionalities in an environment like a general pet store setting was what developed into this project. For this project, we used PHP with Bootstrap as front-end and JavaScript SQL Data Mini SET in order to perform a more efficient search for the clients. Server-side scripting, such as user authentication; then transaction processing (e.g. a form on knives.htm checks companies. htm the company directory and returns an appropriate response); lastly data manipulation in order to change page content dynamically from disk investment). To do each of these chores PHP offers an effective alternate solution! As bootstrap is used to make the User interface responsive and user interaction so that our application to be accessed easily in any devices from mobile tablets etc. JavaScript can enhance frontend interactions, allow for dynamic content updates and improve user experience. SQL is part of a database management system, and allows for record storage, retrieval, searching & sorting. The Pompom Pet Shop information system is designed to be able to support features like, category-based search of products and real-time product uses are created as well; input transaction up until editing can also be done by the user. And most importantly it provides comprehensive reporting together with sales which may carried out offline/online from local + web application. This process is not only built to operate sales, but it also offers observations that can be used when forming strategic and customer service decisions.

Keywords: Pet Shop Cashier, information system, PHP, MySQL
